## **1.0 INTRODUCTION**

This report presents the findings of the remedial soil activities and risk assessment completed for the Mobil Jalk Fee Property, located at 10607 Norwalk Boulevard in Santa Fe Springs, California (Figure 1). This work was performed in accordance with the TRC Alton Geoscience (TRC) Remedial Action Plan (RAP) dated October 20, 2000 and Revised RAP dated November 8, 2000.

## **2.0 SITE DESCRIPTION**

The site consists of approximately 8.8 acres of undeveloped land located in the southwest portion of an active oil field. The site has been used for oil production since the 1920s and ceased with the recent abandonment of the oil wells, pipelines and tank farm by the current tenant, Hathaway Oil Company. No structures currently exist onsite. Previous site structures included the following:

- Nine oil production wells (Jalk 1, 2, 3, 4, 111, 112, 113, 114, and 117) (Figure 2).
- From approximately the early 1940s to October 2000, a former tank battery consisting of six above-ground tanks was located in the northwest corner of the site (Figure 2).
- Former sumps (mud pits) associated with oil drilling and production were observed in the 1928 and 1938 historic aerial photographs.
- From approximately 1920 to the late 1940s, a small oil refuse area (boneyard area) used for the storage of metal objects was present in the southwest portion of the property (Figure 2).
- Above-ground storage tanks were observed in the southeast portion of the property in the 1928 and 1938 aerial photographs.

A portion of the site was leased to a trucking operation in the northeastern and central portion of the site (dates unknown) (Alton Geoscience, 1997).

Adjacent properties have been developed for industrial and commercial use. The Continental Heat Treating, Inc. (CHT) facility, located adjacent to the southeastern property line of the site, uses tetrachloroethylene (PCE) for business operations. The company has been operating at this location since 1969 (Alton Geoscience, 1997).

**Site Closure Report and Risk Assessment**  
**Mobil Jalk Fee Property**  
**November 28, 2000**

---

An ongoing groundwater characterization study is being conducted by the Oil Field Reclamation Project (OFRP) on approximately 272 acres of undeveloped land adjacent to the site to the northeast. Area B of the OFRP project is located approximately 750 feet northeast (upgradient) of the Jalk Fee Property. The results of the OFRP study suggest that dissolved-phase hydrocarbons have impacted groundwater regionally with volatile organic compounds (VOCs) including benzene, PCE, and TCE and semi-volatile organic compounds (SVOCs) including phenolic compounds (Alton Geoscience, 1997).

## **2.1 HYDROGEOLOGIC SETTING**

The site is located within the Santa Fe Springs Oil Field on the Santa Fe Springs Plain, which is part of the Montebello Forebay non-pressure area of the Central Basin. Groundwater is found throughout the region under unconfined conditions in the Recent Alluvium and in the underlying Exposition Aquifer. Within the Santa Fe Springs Oil Field, the upper 100 feet of sediments consist predominantly of permeable sands, although the upper 15 feet of sediments have a higher silt and clay content and lower permeability. According to the California Department of Water Resources (CDWR) Bulletin 104 (1988), the first regional groundwater-bearing zone is the Exposition Aquifer, which is first encountered at approximately 60 fbg. The second regional aquifer is the Gage Aquifer, first encountered at approximately 110 fbg.

The Los Angeles County Department of Public Works (LACDPW) has information on a well (number 1625-N) located approximately two-thirds of a mile northwest of the Jalk Fee property, at the intersection of Telegraph Road and Norwalk Boulevard. Groundwater in this well was measured at 58 fbg on April 30, 1992, which corresponds with the top of the saturated portion of the Exposition Aquifer.

Significant hydrologic features in the area included the San Gabriel River, which flows approximately north-south along the western edge of the city. There are also two extensive water spreading grounds/percolation basins approximately 1 to 2.5 miles northwest of the city limits. These features will act as groundwater recharge, or "mounding" areas, thus inducing groundwater flow away from them (Alton Geoscience, 1997).

## **3.0 PREVIOUS SITE ASSESSMENT ACTIVITIES**

In August 1988, Woodward-Clyde drilled soil borings in the eastern portion of the site. A 1994 McLaren-Hart report indicated no final report of this site assessment work was generated (Alton Geoscience, 1997).

**Site Closure Report and Risk Assessment**  
Mobil Jalk Fee Property  
November 28, 2000

---

Between November 1990 and September 1991, a total of 27 borings (inferred SB and SS borings) were drilled by McLaren-Hart at various locations within the property to depths ranging from approximately 20 to 55 feet below grade (fbg). Additionally, several trench excavations were completed in the former boneyard and in eight former sump areas, and a shallow methane gas survey was conducted. Maximum concentrations of 2,500 milligrams per kilogram (mg/kg) PCE were detected in trench soil sample T9A-1A, located in the southeast portion of the property, at a depth of approximately 4 fbg. A maximum concentration of 29,000 mg/kg petroleum hydrocarbons (C5 to C30) was detected in a soil sample collected from the southeast portion of the property. A concentration of 0.037 mg/kg PCE was also detected in a surface sample collected along the northern property boundary (SS-1) (Alton Geoscience, 1997).

Groundwater Monitoring Wells MMW-3 through MMW-5 were installed at the Jalk Fee site in January 1994 by McLaren-Hart. These monitoring wells were installed to assess whether past onsite oil production activities and/or offsite properties have impacted groundwater beneath the Jalk Fee property (Alton Geoscience, 1997).

Between July and September 1994, McLaren-Hart completed a total of 18 Geoprobe borings (GP-1 through GP-18) at the site to total depths ranging from 30 to 48 fbg in the southeastern portion of the site. PCE was detected in Boring GP-6 at a depth of approximately 15 fbg (maximum concentration of 55,000 mg/kg). The maximum concentration of 27,000 mg/kg total recoverable petroleum hydrocarbons (TRPH) was detected in Boring GP-1 at a depth of approximately 20 fbg (Alton Geoscience, 1997).

In December 1995, McLaren-Hart completed additional site assessment activities which included the drilling/advancement of:

- A total of 15 Geoprobe borings (MH-2, MH-4 through MH-6 through MH-9 [northwest portion of site], MH-10 and MH-11 [northeast portion of site], and GP-19 through GP-24 [southeast portion of site] to total depths of up to approximately 40 fbg.
- One continuously sampled Geoprobe boring (Macro) to a total depth of approximately 42 fbg in the southeast portion of the site.
- 20 hand auger borings to total depths of approximately one fbg in the vicinity of the former bioremediation cells.
- Two hollow-stem auger borings (MB-1 and MB-2) to depths of approximately 60 fbg to further characterize the vertical extent of impacted soil in the southern portion of the site.
- Nine soil gas probes (SG-1 through SG-9) in the area of the suspected former trucking operations in the central portion of the site to depths of approximately 5 and 10 fbg.

The maximum concentration of 4.1 mg/kg PCE was detected in Boring MB-1 at a depth of approximately 25 fbg. The deepest detected impacted soil (0.055 mg/kg PCE) was encountered

## **Site Closure Report and Risk Assessment**

Mobil Jalk Fee Property

November 28, 2000

---

in Boring MB-1 at a depth of approximately 55 fbg (maximum depth of investigation 59 fbg) (Alton Geoscience, 1997).

In June and July 1997, Alton Geoscience drilled 22 Geoprobe borings (GP-25 through GP-46) and nine hollow-stem auger soil borings (HS-1 through HS-9). Maximum TRPH (9,100 mg/kg in GP-25 at 10 fbg) and chlorinated hydrocarbon (42 mg/kg PCE at GP-40 at 5 fbg) concentrations were detected near the southern property line of the site in the vicinity of the former CHT degreaser line locations identified by McLaren-Hart in the 1996 Phase I Environmental Site Assessment (ESA) report (Alton Geoscience, 1997).

In December 1999 through January 2000, ATC Associates, Inc. (ATC) (consultant for The O'Donnell Group, Inc.) completed a Phase I and II ESA and methane gas study at the site. The Phase II ESA report indicated minor TRPH impacts were observed in two areas (740 mg/kg at P-12 at 10 fbg [under proposed Building A location] and 1,570 mg/kg at A-2 at 10 fbg [just south of proposed Building C location]). The methane gas study indicated "there is a very low likelihood that elevated concentrations of methane gas are present at the site in near-surface soils."

A summary of the findings of the previous site assessment activities is provided below:

- Soil contaminants beneath the site generally consisted of halogenated volatile organic compounds (HVOCS; primarily PCE and TCE) and petroleum hydrocarbons. Based on information obtained during previous studies, the possible HVOCS source is from the CHT site to the south of the Jalk Fee property. In addition, other petroleum hydrocarbon impacted soil onsite is likely related to the site's land use history as a petroleum production field.
- Soil encountered beneath the site generally consists of silty sand, sandy silt, and silt from grade to approximately 40 fbg with interbeds of sand between approximately 10 and 20 fbg. Sand is generally present between approximately 40 and 100 fbg (maximum depth of investigation, based on boring logs from McLaren-Hart).
- Groundwater is present beneath the Jalk Fee site (MMW-3 through MMW-5) at approximately 70 fbg with a south-southwest flow direction (TRC, 2000). Based on available historical data, maximum concentrations of 2,200 micrograms per liter ( $\mu\text{g}/\text{L}$ ) PCE and 180  $\mu\text{g}/\text{L}$  TCE were detected in MMW-5 in March 1995 (Alton Geoscience, 1997). HVOCS-impacted groundwater is likely affected by offsite sources.

---

### **4.0 PREVIOUS REMEDIAL ACTIVITIES**

In May 1994, soil treatment was initiated in two bioremediation cells (Cell #1 and Cell #2) at the site by McLaren-Hart. Soil in the bioremediation cells was derived from properties in the Mobil Operated Santa Fe Springs Oil Field including the Jalk Fee (720 cubic yards), DeWenter/Jordan/Green (23,000 cubic yards), Baker/Humble (8,950 cubic yards) properties, and the "Oil Well 732-C" site (1,600 cubic yards). Confirmation soil samples were collected from the cells in December 1995, and closure of the bioremediation cells was received in April 1997 (Alton Geoscience, 1997).

In 1996, McLaren-Hart completed the remediation of lead contaminated soil from the "boneyard area" in the southwest corner of the site. McLaren-Hart received closure from the Department of Toxic Substances Control (DTSC) in December 1996.

In June 1998, Alton Geoscience completed the remediation of HVOC and petroleum hydrocarbon contaminated soil in three areas along the southern property line of the site. At the completion of the soil remediation work, a fate and transport model was completed to show that the concentrations of the residual hydrocarbons left in-place posed no risk to groundwater. Based on the results of the soil remediation activities and the fate and transport model, the California Regional Water Quality Control Board (CRWQCB) issued a closure letter on March 1, 1999 (Alton Geoscience, 1999).

In September and October 2000, ATC was contracted by Hathaway Oil Company to remove petroleum pipelines and the tank battery in the northwest corner of the site as well as remediate contaminated soil encountered during this removal work associated with historical Hathaway Oil Company operations. The pipelines and tank battery removal was completed in October 2000 with the soil remediation activities still in progress. In addition, the abandonment of the remaining onsite oil wells which were operated by Hathaway Oil Company was completed in October 2000 by AllenCo.

### **5.0 REMEDIAL FIELD ACTIVITIES**

Remedial activities (soil excavation, confirmation soil sampling and analysis, soil treatment and soil import and compaction) were completed from October 24 to November 21, 2000 in accordance with the TRC RAP dated October 20, 2000 and revised RAP dated November 8, 2000.

#### **5.1 SOIL EXCAVATION**

Soil was excavated from areas identified as SB-49, M-1, M-2, M-3, M-7, M-8 and M-9 on Figure 2. Soil was excavated and stockpiled onsite until based on field observations (visual and organic vapor

## **Site Closure Report and Risk Assessment**

Mobil Jalk Fee Property

November 28, 2000

---

monitor [OVM] readings), it was determined hydrocarbon impacted soil above the established cleanup standards has been removed. A summary of each excavation is provided below:

AREA	LENGTH (feet)	WIDTH (feet)	DEPTH (fbg)
SB-49	100	12	6 to 13
M-1	30	30	14
M-2	15	15	10
M-3	40	40	19
M-7	30	15	13
M-8	30	20	13
M-9	50	50	24

Hydrocarbon impacted soil above the established cleanup standards were excavated in each area with the exception of M-1, M-3, and M-9. Based on the depth of the hydrocarbon impacted soil encountered at the following excavation areas:

- M-1 at 14 feet below grade (fbg) (334 mg/kg for C4-C12, 2,020 mg/kg for C13-C22 and 3,200 mg/kg for C23-C40);
- M-3 at 19 fbg (5,510 mg/kg for C4-C12, 4,630 mg/kg for C13-C22 and 3,796 mg/kg for C23-C40); and
- M-9 at 24 fbg (658 mg/kg for C4-C12, 1,219 mg/kg for C13-C22 and 697 mg/kg for C23-C40),

TRC completed a risk assessment (Section 7.0) for the in-place hydrocarbon concentrations at these locations. Figure 2 shows the location and extent of each excavation. Other general excavation procedures are outlined in Appendix A.

### **5.2 CONFIRMATION SOIL SAMPLING AND ANALYSIS**

Confirmation soil samples were collected in the base and sidewalls of each excavation. The depth of the sidewall confirmation soil samples were determined based on field observations as discussed in the previous section. If the initial confirmation soil samples exceeded the established cleanup standards, additional soil was excavated in these areas and confirmation samples were recollected.

Each confirmation sample was analyzed at a State of California certified hazardous waste testing laboratory for carbon chain identification using EPA Method 8015M, VOCs using EPA Method 8260B, and lead and arsenic using EPA Method 6010B. Confirmation soil sample results are summarized in Tables 1, 2 and 3 and the laboratory reports are provided in Appendix B.

## **Site Closure Report and Risk Assessment**

Mobil Jalk Fee Property

November 28, 2000

---

### **5.3 SOIL TREATMENT**

From November 10 to November 15, 2000, 1,775.82 tons soil was transported to American Remedial Technologies (ART) for thermal treatment under a non-hazardous waste manifest. Copies of the trucking logs and manifests are provided in Appendix C.

### **5.4 IMPORT AND COMPACTION**

A total of 2,235.77 tons of soil (264 tons backhauled from ART and 1,971.77 tons from West Coast Sand and Gravel) was imported to the Jalk Fee property to backfill the excavations at the site. Backhauling of soil from ART was ceased on November 14, 2000 due to the difficulty in compacted this soil.

Compaction testing using ASTM Method D1557 of the clean overburden generated during the remedial activities and of the imported soil from ART and West Coast Sand and Gravel was completed to generate the compaction curves for each soil type. Based on the compaction test results, soil was backfilled in the excavations in lifts and tested in the field for compaction by the nuclear method. Backfilling and compaction was complete on November 20, 2000. Copies of the import logs, bill of ladings, and laboratory reports (chemical and physical testing of the import) is included in Appendix D.

## **6.0 RESULTS OF REMEDIAL ACTIVITIES**

The results of the remedial activities are summarized as follows:

- Hydrocarbon impacted soil above the established cleanup standards were excavated in each area with the exception of M-1, M-3, and M-9. Based on the depth of the hydrocarbon impacted soil encountered at excavation areas M-1 (14 fbg), M-3 (19 fbg), and M-9 (24 fbg), TRC completed a risk assessment (Section 7.0) for the in-place hydrocarbon concentrations at these locations.
- A total of 1,775.82 tons soil was excavated and transported ART for thermal treatment.
- A total of 2,235.77 tons of soil was imported to the Jalk Fee property to backfill the excavations at the site. Soil was placed in the excavations in lifts and compacted.

## **7.0 RISK ASSESSMENT**

To evaluate if contaminated soil and groundwater pose a potential risk to humans associated with the proposed development of the subject site, available data were evaluated, a receptor/pathway exposure assessment was completed, available toxicity data were reviewed, and the potential risk to humans was estimated. Both carcinogenic and non-carcinogenic risks were evaluated. The

## **Site Closure Report and Risk Assessment**

Mobil Jalk Fee Property

November 28, 2000

---

equations and input parameters used for risk simulations have been summarized and are included in Appendix E. In addition, a supplemental fate and transport analysis was conducted in order to evaluate whether the residual chlorinated hydrocarbons in soil pose a significant threat to groundwater underlying the site. An overview of the supplemental fate and transport analysis and the results of the modeling are provided in Appendix F.

### **7.1 EXPOSURE ASSESSMENT**

An exposure assessment is the process of estimating potential human exposure to a chemical in the environment. An exposure assessment is conducted to estimate the magnitude of actual and/or potential human exposures, the frequency and duration of these exposures, and the pathways by which humans are potentially exposed. In a typical exposure assessment, reasonable maximum estimates of exposure are developed for both current and future land-use assumptions (EPA, 1989b). Reasonable maximum estimates of exposure were developed for the subject site under current and anticipated future land use. This assessment also includes an evaluation of the potential risks to construction working during site development.

Off-site potential receptors/pathways other than those directly associated with the future site development were not considered in this risk assessment. However, an onsite baseline assessment of potential human exposures to volatile organic compounds in air was performed. This baseline assessment is considered to a conservative, yet representative, evaluation of potential human health risks associated with current, baseline conditions. Risks that are protective of onsite exposures would also be protective of offsite exposures.

The primary components of an exposure assessment include:

- Identification of the potential exposure pathway(s),
- Identification of reasonable exposure scenarios, and
- Prediction of chemical concentrations at points of potential exposure.

Exposure pathways are identified based on consideration of the sources, releases, types, and locations of chemicals at the site; the environmental fate of chemicals, and the location and activities of potentially exposed populations (EPA, 1989b). For a complete exposure pathway to exist, the following elements must be present:

- A source or mechanism for chemical release,
- An environmental transport medium,
- A point of human exposure with the medium, and
- A route of exposure

**Site Closure Report and Risk Assessment**  
**Mobil Jalk Fee Property**  
**November 28, 2000**

---

An incomplete exposure pathway is one which does not result in potential human exposure and, therefore, does not result in a significant risk. If a complete exposure pathway is identified, potential exposures may be quantified and risk evaluation performed or the exposure pathway may be eliminated through remedial measures or other engineering and administrative controls.

According to EPA (1989b), exposure pathways may be excluded from quantitative evaluation based on the following conditions:

- The exposure resulting from the pathway is much less than that from another pathway involving the same medium at the same exposure point,
- The potential magnitude of exposure from a pathway is low, or
- The probability of exposure occurring is very low and the risks associated with the occurrence are not high.

Estimates of exposure in this assessment are based on soil and groundwater quality data collected during previous environmental investigations (excluding data collected prior to remedial activities) and environmental fate modeling. The details and methodology associated with the environmental fate and transport modeling of chemicals in the vadose zone are discussed in Appendix F.

### **7.1.1 Exposure Pathways and Scenarios**

Typical exposure pathways as specified by the EPA have been considered (EPA, 1991b). This evaluation identifies the potential receptors and exposure pathways through which humans (i.e., receptors) can potentially be exposed to chemicals. Potential exposure pathways were evaluated to reflect the actual site conditions and anticipated future land use without being unrealistically conservative. The uncertainties associated with assumptions regarding specific property development activities and planned land use are not considered to have a substantive effect on the exposure pathway analysis unless such activities or land use are dramatically different from that assumed for this analysis. An example of a dramatically different land use would include, for example, construction of a school, daycare center, or residences on the subject property. Given the current site zoning and surrounding land use, it does not appear that these alternate land use scenarios are likely.

Pathways that do not exist, are not relevant to the subject property development plans, or have a low potential of exposure were excluded from further consideration and were not evaluated quantitatively. For example, impacted soils exist below the ground surface and exposure pathways which require direct contact with impacted soil (i.e., dermal contact and incidental ingestion of soil) were considered only for construction workers who may come into contact with soil during onsite grading and trenching. The vast majority of the site will either be paved or

## **Site Closure Report and Risk Assessment**

Mobil Jalk Fee Property

November 28, 2000

---

covered with structures or other improvements under a post-development scenario. If future direct contact with impacted soil were to occur, it is anticipated that the frequency and magnitude of the exposure would be low. Consequently, direct contact with impacted soil under a post-development scenario was not quantitatively evaluated.

The potential exposure pathways and populations that were quantitatively evaluated in this risk assessment are:

- Baseline exposure conditions (current site conditions prior to development). The baseline exposure conditions include analysis of potential human health risks associated with inhalation of volatile compounds from subsurface soil by a hypothetical outdoor worker.
- Inhalation of volatile compounds from subsurface soil and groundwater by construction workers and future property employees and/or visitors (indoor and outdoor),
- Incidental ingestion of contaminated soil by construction workers involved in subsurface activities,
- Inhalation of fugitive dust by construction workers involved in subsurface activities, and,
- Dermal exposure to contaminated soil by construction workers involved in subsurface activities.

Note that a quantitative evaluation of risk to subject property visitors was not explicitly evaluated because it was assumed that the visitor duration would be significantly less than that of an onsite employee. Again, the exposure to children of visitors would also be significantly less than that of an employee even though children have a lower body weight and may be more susceptible to chemical exposures. The lower body weight and higher susceptibility is offset by the substantially lower exposure duration of a child. Therefore, if any exposures that are protective of employees will also be protective of adult and juvenile visitors.

Although the groundwater in the vicinity of the subject property is impacted by volatile organic compounds, the depth to groundwater precludes potential direct exposure to this matrix. Furthermore, no onsite or adjacent offsite use of groundwater has been documented. Consequently, potential exposures (e.g., ingestion of drinking water) associated with utilized groundwater were not quantitatively evaluated. An environmental fate and transport analysis of the potential impact to groundwater related to the presence of residual PCE in soil is discussed in Section 7.1.1.4.

The potential human exposure conditions were evaluated for potential construction workers and future subject property employees based on a reasonable maximum exposure (RME) scenario. The RME scenario represents an estimate of the reasonable maximum exposure that expected to occur under both current and future land use considerations. In general, the RME is defined as the highest exposure that is reasonably expected to occur at a site. The RME is estimated for individual

## **Site Closure Report and Risk Assessment**

Mobil Jalk Fee Property

November 28, 2000

---

exposure pathways (e.g., inhalation of volatile compounds, incidental ingestion of soil, and dermal contact with soil). Where potential exposures occur through more than one exposure pathway, the combination of exposures across all pathways represents the cumulative RME scenario. The intent of the RME is to estimate a conservative exposure condition (i.e., well above the average exposure) that is still within the range of possible exposures.

### **7.1.1.1 Potential Human Exposure Under Baseline Conditions**

Baseline conditions are intended to simulate environmental conditions at the Site as they exist today for a worker who is at the Site, but is not involved in activities that would disrupt contaminated soil. For example, these workers could include a security guard patrolling the Site, a construction supervisor, or an occasional site visitor. In general, the baseline conditions are intended to evaluate the potential human health impacts that could result prior to the proposed development of the property. The following approach was used to estimate exposure concentrations and risk:

- The exposure route and pathway is inhalation of volatiles from subsurface soil;
- The higher of either the normal or log-normal 95% UCL concentrations for each VOC in soil was used in the simulation (Table E-1);
- Except for exposure duration, default input parameters from EPA guidance documents were used (EPA, 1991b); and
- Exposure duration was assumed to be five days per week for 2 years, which would simulate an upper-bound estimate of the period before site development is initiated.
- Site specific parameters such as soil porosity, moisture content, and bulk density were used in the estimation of exposure point concentrations of volatile compounds in air.

### **7.1.1.2 Potential Construction Worker Exposures**

The risk to construction workers is intended to simulate a worker involved in the disruption of contaminated soil during grading, trenching, and other subsurface activity such as connecting to the sewer system or installing subsurface electrical utilities. The following approach was used to estimate exposure concentrations and risk:

- Exposure routes and pathways evaluated include dermal contact, inhalation of vapors and fugitive dust, and incidental ingestion of soil;
- The higher of either the normal or log-normal 95% UCL concentrations for each COPC in soil and groundwater from the Site were used in the simulations (Tables E-1 through E-4);
- All impacted soil, regardless of depth, was considered to be potentially available for contact during the construction activities. In reality, it is likely that construction activities would only involve direct contact with the first 5 to 10 feet of soil. Therefore, the use of all soil data

## **Site Closure Report and Risk Assessment**

Mobil Jalk Fee Property

November 28, 2000

---

in the construction worker exposure scenario is a simplifying and conservative assumption as the highest chemical concentrations that remain in soil are generally located at depths of greater than 10 feet below grade;

- Standard EPA RAGS equations were used to simulate the risk;
- Except for exposure duration and selected site specific parameters, default input parameters from EPA guidance documents were used (EPA, 1991b);
- Exposure duration was assumed over a period of six months. This time period represents the amount of time during which activities involving the disturbance of subsurface soil would be expected to occur.
- Site specific parameters such as soil porosity, moisture content, and bulk density were used in the estimation of exposure point concentrations of volatile compounds in air.

### **7.1.1.3 Potential Future Onsite Worker Exposures (Post Development)**

The risk to potential future employees working within structures located on the developed property is intended to conservatively simulate a typical onsite worker exposure. Since the precise nature of the activities performed by future onsite employees is not known, potential exposures are evaluated for both indoor and outdoor occupations. A typical indoor employee would be an office worker or stock person working inside a proposed building. A typical outdoor employee would be a security guard working outside in the proposed parking lot area. Under the post development exposure scenario, the dermal and incidental ingestion of soil exposure scenarios is incomplete (due to the anticipated presence of paving and buildings across the majority of the subject site) and is not quantitatively evaluated. The following approach was used to estimate exposure concentrations and risk:

- The route of exposure is inhalation of vapors from both soil and groundwater;
- For soil, the higher of either the normal or log-normal 95% UCL concentration of chemicals in soil as determined from previous site assessment and post-remedial confirmation sampling were used in the simulations (Table E-1);
- The higher of either the normal or log-normal 95% UCL concentrations of chemicals in groundwater from Monitoring Wells MW-3, MW-4, and MW-5 as determined from data collected between March 1994 and August 2000 were used in the simulations (Table E-2).
- Except for a slab attenuation factor, standard EPA RAGS equations were used for indoor employees (EPA, 1991b) and standard EPA preliminary remediation goal (PRG) equations were used for outdoor employees (EPA, 1995);
- A 100-fold concrete slab attenuation factor was used in the simulations to be conservative. The slab attenuation factor accounts for the decrease permeability and diffusion of volatile organic compounds through either an asphalt or concrete surface. In some cases, the EPA has recognized 1000-fold slab attenuation factors, which is 10 times higher than the slab

## **Site Closure Report and Risk Assessment**

Mobil Jalk Fee Property

November 28, 2000

---

attenuation factor used in this risk assessment. The use of a higher slab attenuation factor would result in a lower estimate of exposure and risk;

- Except for selected site specific parameters, default input parameters from EPA guidance documents were used (EPA, 1991b); and
- Site specific parameters such as soil porosity, moisture content, and bulk density were used in the estimation of exposure point concentrations of VOCs in air.

### **7.1.1.4 Environmental Fate and Transport Analysis**

Environmental fate and transport analysis was previously performed and is described in the Site Assessment Report/Remedial Action Plan dated October 10, 1997. The previous environmental fate and transport analysis was conducted using the vadose zone chemical transport model SESOIL to simulate precipitation-driven migration of chlorinated solvents PCE, TCE, and cis-1,2-DCE and crude oil (using a naphthalene surrogate to represent potential migration of crude oil range hydrocarbons). The 1997 fate and transport analysis was based on the estimated lateral and vertical extent of solvent-affected soil. Chemical mass loading and soil properties used in the fate and transport model were based on site-specific data. The results of this fate and transport analysis indicate that additional remediation measures for the protection of groundwater resources are not warranted.

Despite the conclusion of the previous environmental fate and transport analysis that additional remediation was not required to protect groundwater, two remedial excavation events have been conducted on the subject site since 1997. These remedial excavations removed the primary solvent and crude-oil affected areas formerly present on the site. During the course of remedial excavation, additional confirmatory soil sampling data was obtained. The changes in site conditions and distribution of residual chlorinated and petroleum hydrocarbons resulting from the remedial excavation effort and associated confirmation sampling warrant that the previous environmental fate and transport modeling analysis be revisited.

A supplemental fate and transport modeling analysis was conducted as a component of this risk analysis. The objectives of the environmental fate and transport analysis are to:

- Refine the input parameters used in the previous environmental fate and transport analysis based on current information available regarding the concentration and distribution of PCE in soil following completion of the remedial excavations.
- Evaluate the potential for residual PCE in soil to impact groundwater underlying the subject site.
- Quantify the magnitude of potential future leaching of PCE to groundwater underlying the subject site.

**Site Closure Report and Risk Assessment**  
**Mobil Jalk Fee Property**  
**November 28, 2000**

---

An overview of the methodology and assumptions incorporated into the fate and transport analysis and the output of the fate and transport analysis are provided in Appendix F.

### **7.1.2 Exposure Concentrations**

Exposure concentrations are dependent upon the fate and transport of the contaminants in the subsurface and into areas to be occupied by humans such as outdoor and indoor air. Typical EPA exposure models were used in this assessment. To minimize uncertainty, site-specific parameters were input into the model, where available. For example, site-specific contaminant concentrations and soil characteristics such porosity, moisture content, and bulk density were used in the models. Appendix E presents the mathematical models, equations, and input parameters used for this risk assessment.

Direct exposures to soil and diffusion of VOCs from soil into outdoor and indoor air were evaluated based on the upper 95% confidence interval (UCL) of the mean for soil samples collected on the subject site. The UCL was calculated assuming both a normal and lognormal distribution of the data. The higher of either the normal or the lognormal UCL was used to estimate potential exposure point concentrations. It should be noted that the use of arithmetic or geometric mean values (as opposed to upper 95% confidence interval values of the mean) for chemicals in soil and groundwater would result in lower risk estimates than are calculated under the RME scenario. This approach is intended to ensure that both construction worker and future onsite employee health and safety is adequately protected.

## **7.2 TOXICITY ASSESSMENT**

Several analytes have been identified in soil and/or groundwater samples collected at the site. It should be noted that only those analytes that have been detected in either subsurface soil or groundwater and that have not been removed by remedial excavation are included for quantitative analysis. Analytes included in the quantitative risk analysis are summarized below:

### **Semi-Volatile Organic Compounds**

- Acenaphthene
- Naphthalene
- Phenanthrene

Note: Other PAHs detected in soil at depths of between 0 and 10 fbg that was removed during subsurface remedial excavation are not included in this summary. Soil that contained detected concentrations of benzo(a) pyrene, benzo(a) anthracene, chrysene, dibenzo(a,h)

## **Site Closure Report and Risk Assessment**

Mobil Jalk Fee Property

November 28, 2000

---

anthracene, fluoranthene, indeno(1,2,3-cd) pyrene was removed during remedial excavation activities.

### **Volatile Organic Compounds**

- 1,2,4-Trimethylbenzene
- 1,3,5-Trimethylbenzene
- Benzene
- Bromodichloromethane
- Chlorobenzene
- cis-1,2-Dichloroethene
- Ethylbenzene
- Isopropyl benzene
- n-Butylbenzene
- n-Propylbenzene
- sec-Butylbenzene
- Styrene
- tert-Butylbenzene
- Tetrachloroethene (PCE)
- Toluene
- Vinyl chloride
- Xylenes

### **Metals**

- Arsenic
- Cadmium
- Chromium (Total)
- Copper

Total petroleum hydrocarbons expressed as total recoverable petroleum hydrocarbons have also been detected in soil samples collected at the subject site. Given the absence of specific toxicological criteria for unspecified petroleum hydrocarbons, general petroleum hydrocarbons are not quantitatively evaluated in this assessment. However, the evaluation of potential exposure and risk was conducted for the individual chemicals that may be present in an undifferentiated petroleum hydrocarbon matrix (e.g., polynuclear aromatic hydrocarbons, aliphatic hydrocarbons, and aromatic hydrocarbons). This approach ensures that potential risks associated with the most toxic petroleum hydrocarbons that remain in subsurface soil are adequately characterized. Other chemicals (primarily chlorinated hydrocarbons) have also been detected at the site and are quantitatively evaluated in the risk assessment process.

**Site Closure Report and Risk Assessment**  
Mobil Jalk Fee Property  
November 28, 2000

---

Based on the availability of toxicological data, a comprehensive evaluation of the dose-response literature and criteria was not performed for this risk assessment. Instead, dose-response criteria (e.g., Cancer Slope Factors and Reference Doses) derived by the United States Environmental Protection Agency (EPA) or California Environmental Protection Agency has been used in the risk calculations. Generally, the EPA-established dose-response criteria have been reviewed by a number of authorities and the values are representative of conservative estimates of human response to the indicator chemicals. Sources of information which were consulted included:

- Integrated Risk Information System (IRIS)
- Health Effects Assessment Summary Tables (HEAST)
- EPA Environmental Criteria and Assessment Office (ECAO) Documents
- National Center for Environmental Assessment (NCEA) (formerly ECAO)
- Agency for Toxic Substances and Disease Registry (ATSDR) Toxicological Profiles
- California EPA Office of Environmental Health Hazard Assessment (CalEPA)

Input parameters obtained from these sources were used in the risk assessment simulations (Appendix E, Table E-5). Toxicity data were not available for substituted benzene compounds such as isopropylbenzene, n-butylbenzene, n-propylbenzene, sec-butylbenzene, tert-butylbenzene and p-isopropyltoluene. With the exception of p-isopropyltoluene, the toxicological properties of these compounds were conservatively assumed to be equivalent to ethylbenzene. P-isopropyltoluene was evaluated as toluene. These compounds were addressed in the risk assessment simulations by adding the calculated 95% UCL concentration of each compound to the ethylbenzene or toluene concentration.

Toxicity data were also not available for phenanthrene. Phenanthrene is similar to naphthalene in structure. Phenanthrene was quantitatively evaluated by adding the calculated 95% UCL concentration of phenanthrene to the naphthalene concentration in soil.

### **7.3 RISK ASSESSMENT RESULTS**

Risk characterization yields upper-bound estimates of carcinogenic and non-carcinogenic health risks by combining the quantitative exposure and dose-response estimates. The estimation of non-carcinogenic health risks is evaluated through the calculation of a Hazard Index. The Hazard Index is the ratio of the quantitative estimate of ambient concentration to the chemical-specific Reference Dose. The intent of the risk and hazard index estimate is to yield reasonable quantitative values of potential exposure without using such extreme assumptions that the estimates become unrealistic.

In the risk assessment of human exposures to carcinogenic chemicals under this evaluation, the *de minimis* or insignificant risk level of 1 in 1,000,000 ( $1 \times 10^{-6}$ ) was used. This *de minimis* risk

## **Site Closure Report and Risk Assessment**

Mobil Jalk Fee Property

November 28, 2000

---

is the most conservative in a range of acceptable risk levels that have historically been applied in risk management decision making. In general, de minimis risks in federal regulatory decision making have ranged from 1 in 10,000 ( $1 \times 10^{-4}$ ) to 1 in 1,000,000 ( $1 \times 10^{-6}$ ). In general, acceptable risks of  $1 \times 10^{-6}$  have been used where large populations may be exposed. Higher risks (e.g.,  $1 \times 10^{-4}$ ) have been considered to be acceptable when relatively small populations may be exposed.

For non-carcinogenic effects, a Hazard Index approach is used to evaluate potential risks. The hazard index approach assumes that non-carcinogenic effects occur when a threshold level of exposure is exceeded. Therefore, a hazard index of 1.0 or less indicates that no adverse non-carcinogenic health risks are expected to occur.

Carcinogenic and non-carcinogenic risks were estimated using standard EPA equations as presented in Appendix E. Summaries of the analytical results and statistical analysis of soil and groundwater samples obtained from the subject site are provided in Appendix E, Tables E-1 through E-4. The toxicity criteria and exposure parameters used in the calculation of carcinogenic and non-carcinogenic risks are provided in Appendix E, Tables E-5 and E-6, respectively. Estimates of exposure point concentrations and calculations of carcinogenic and non-carcinogenic risks are provided in Appendix E, Table E-7 through E-31. Overviews of the carcinogenic and noncarcinogenic risk estimates for each of the exposure pathways are provided in Appendix E, Tables E-32 and E-33, respectively.

### **7.3.1 Baseline Conditions Exposure**

The baseline incremental cancer risk is estimated to be approximately  $4 \times 10^{-7}$ , which is less than the  $1 \times 10^{-6}$  criteria for acceptable risk (Table E-7, Appendix E). The baseline non-carcinogenic hazard index is estimated to be approximately 0.01, which is below the 1.0 criteria for acceptable non-carcinogenic risk (Table E-8, Appendix E). Based on these data, there is no apparent threat to human health under the current, pre-development conditions.

### **7.3.2 Construction Worker Exposure**

The cumulative incremental cancer risk (including inhalation of VOCs and fugitive dust, dermal contact, and incidental ingestion of soil) for a construction worker involved in the proposed development is estimated to be approximately  $2 \times 10^{-7}$  (Table E-32). This incremental risk estimate is less than the  $1 \times 10^{-6}$  criteria for acceptable risk. Approximately 73 percent of the estimated risk is attributable to inhalation of vapors from impacted soil and groundwater. Dermal contact with impacted soil accounts for approximately 3% of the total risk. Approximately 24% of the total risk is associated with the incidental ingestion of soil exposure pathway. The risk from the inhalation of fugitive dust is not a significant exposure pathway and

## **Site Closure Report and Risk Assessment**

Mobil Jalk Fee Property

November 28, 2000

---

contributes less than 0.1% of the total carcinogenic risk estimate for the construction worker exposure scenario.

The construction worker non-carcinogenic hazard index is estimated to be approximately 0.04 (Table E-33). Since this hazard index is less than unity (1.0), no adverse non-carcinogenic effects are expected to occur. Approximately 50 percent of the non-carcinogenic risk is attributable to inhalation of VOCs from soil and groundwater. Incidental ingestion of soil accounts for approximately 44 percent of the total non-carcinogenic risk estimate (primarily due to the presence of arsenic, cadmium, and copper) and dermal contact accounts for approximately 6 percent of the remaining non-carcinogenic risk. The non-carcinogenic risk from the inhalation of fugitive dust is insignificant relative to the other exposure pathways. The use of dust control measures during construction activities is encouraged and may be required to control nuisance dust, but is not necessary to protect human health during the construction activities.

Based on this characterization, the estimated risk to construction workers involved with subsurface activities at the Site does not exceed the acceptable risk levels as established by EPA, CalEPA, and other regulatory entities. No specific mitigation or control measures are warranted to protect potential future construction workers from chemical exposures during the development of this property. Development of the subject property can occur without toxic control measures or additional remediation.

### **7.3.3 Future Onsite Worker Exposure**

The risk characterization for the RME scenario for both outdoor and indoor employees is discussed in the following sections.

#### **7.3.3.1 Future Indoor Worker Exposure**

Based on the RME scenario, the potential future indoor employee incremental cancer risk for the vapor inhalation exposure pathway is estimated to be approximately  $1 \times 10^{-6}$ . This value meets the  $1 \times 10^{-6}$  criteria for acceptable risk. Approximately 67 percent of the estimated risk is attributable to inhalation of PCE vapors from impacted soil and 8 percent of the estimated risk is attributable to inhalation of PCE vapors from impacted groundwater (Tables E-21, E-23, and E-32). Vinyl chloride represents approximately 28 percent of the total estimated risk through the inhalation of vinyl chloride from soil emissions.

The potential future indoor employee non-carcinogenic hazard index for the vapor inhalation pathway is estimated to be 0.004. The hazard index estimates for inhalation of vapors from soil and groundwater are presented in Tables E-22 and E-24. Approximately 2 percent of the estimated risk is attributable to inhalation of vapors from VOC impacted groundwater and 98

## **Site Closure Report and Risk Assessment**

Mobil Jalk Fee Property

November 28, 2000

---

percent is from inhalation of vapors from VOC impacted soil (Table E-33). This hazard index estimate accounts for exposure to vapors from both soil and groundwater. Since this hazard index estimate is less than unity (1.0), no adverse non-carcinogenic effects are expected to occur through this exposure pathway.

Based on this RME scenario, the potential risks to future employees working inside of a proposed onsite structure are below acceptable risk levels as established by EPA, CalEPA, and other regulatory entities. Consequently, no mitigation or engineering controls are required to reduce potential risks to acceptable levels. It should be noted that the risk to indoor employees is greater than the risk to a hypothetical outdoor employee. This is logical because the air exchanges outdoors associated with wind should be much higher than default air exchange rates for commercial buildings.

### **7.3.3.2 Future Outdoor Worker Exposure**

Based on the RME scenario, the potential future outdoor worker incremental cancer risk for the vapor inhalation pathway is estimated to be approximately  $5 \times 10^{-8}$ . This value is below the  $1 \times 10^{-6}$  criteria for acceptable risk. Approximately 3 percent of the estimated risk is attributable to inhalation of vapors from impacted groundwater, and 3 percent of the estimated risk is attributable to inhalation of vapors from impacted soil (Tables E-17, E-19, and E-32).

The hazard index estimates for inhalation of vapors from soil and groundwater are presented in Tables E-18 and E-20, respectively. The potential future outdoor employee non-carcinogenic hazard index is 0.0001. For the outdoor air inhalation exposure scenario, approximately 98 percent of the total hazard index is related to inhalation of vapors from impacted soil. Inhalation of vapors from impacted groundwater comprises approximately 2 percent of the total non-carcinogenic hazard index under this exposure scenario. Since the hazard index estimate for the future outdoor worker population is less than unity (1.0), no adverse non-carcinogenic effects are expected to occur through this exposure pathway.

Based on the RME scenario for future outdoor workers, the potential carcinogenic and non-carcinogenic risks for future onsite workers are below acceptable risk levels as established by EPA, CalEPA, and other regulatory entities. Consequently, no mitigation or engineering controls are required to reduce potential risks to acceptable levels.

### **7.3.4 UNCERTAINTIES AND LIMITATIONS**

There is a certain amount of uncertainty in any simulation of natural processes. To account for these uncertainties, the models used in this risk assessment were designed to be conservative or to "err on the safe side". The models in this risk assessment use conservative assumptions, which

**Site Closure Report and Risk Assessment**  
**Mobil Jalk Fee Property**  
**November 28, 2000**

---

do not take into consideration legitimate natural processes such as biodegradation and source reduction. In this respect, the models do not approximate conditions that are likely to occur. Therefore, these models and subsequent risk values are judged to be conservative.

Where values are uncertain because of a lack of site-specific data, regulatory agency default values and/or conservative values have been used. Matrix-specific chemical concentrations were derived from previous environmental assessment and post-remedial confirmation sampling activities conducted on site. These data exclude, where applicable, chemical concentrations previously detected in soil samples that were subsequently removed during remedial excavation activities.

Historical soil and data that have not been remediated have been incorporated into this risk assessment. Certain chemicals (e.g., benzo(a) pyrene and other PAHs) that were detected in limited soil samples collected from areas that were subsequently remediated, were not quantitatively evaluated in this assessment. The exclusion of these chemicals from the quantitative analysis is appropriate as PAHs have not been detected in soil samples collected from areas that have not been excavated. In general, the most significant potential exposure routes for PAHs in soil are dermal contact and incidental ingestion.

The groundwater risk assessment (i.e., volatilization of chemicals from groundwater into outdoor or indoor air) considers the volatile organic compound analyses obtained over the past six years of groundwater monitoring and sampling. Impacts to risk calculations from model input parameters and assumptions are discussed in the following section.

A substantial source of conservatism inherent in the human health risk assessment and fate and transport analysis involves the assumption of a non-diminishing source as a simplifying mechanism. The assumption of a non-diminishing source neglects natural biological degradation and diffusion as loss mechanisms in the subsurface environment. The reader is encouraged to consider this assumption in light of the calculated human health risks and modeled impact to groundwater.

In some cases, the EPA has recognized slab attenuation factors for diffusion of vapors through building foundations as high as 0.001. This factor is 10 times higher than the slab attenuation factor used in this risk assessment. If the higher slab attenuation factor were used, then the resulting risks would be decreased by a factor of 10. Although the conservative approach yields a higher estimate of potential human health risk, we have elected to err on the safe side to provide an additional safety factor for the subject property.

**Site Closure Report and Risk Assessment**  
Mobil Jalk Fee Property  
November 28, 2000

---

#### **7.3.4.1 Biased Data**

Site-specific data used in this risk assessment may be biased both spatially and temporally. The potential effects of data bias are incorporated into the risk assessment through the use of upper confidence levels of the arithmetic or geometric mean concentrations in soil and/or groundwater. The net result of the use of upper confidence levels of mean concentrations results in a conservative estimate of potential exposure and risk. The actual exposure and risk are likely to be lower.

##### **Potential for Spatially Biased Data**

The collection of information to characterize the nature and extent of contamination at a site is commonly not designed to provide representative, unbiased data sets for exposure estimates. This is typical for site assessment data when data are not collected in a simple random and/or systematic random manner. The cumulative soils data set is spatially biased because a portion of the soil beneath the subject property contains minimal to non-detect concentrations of contaminants. However, the majority of the existing data set includes data that were purposively collected from impacted areas in order to better define the nature and extent of contamination. Use of the existing data set may create a conservative bias in the estimation of exposure and risk and is likely to overestimate the actual source concentrations, exposure, and risk.

##### **Potential for Temporally Biased Data**

The cumulative data set includes samples collected and analyzed in 1992, 1993, 1995 and 1997. Including data collected in 1992 through 1997 with data collected in 2000 may potentially temporally bias the combined data set. This temporal bias occurs because the loss mechanisms of biodegradation and volatilization to air are not taken into account. Degradation of petroleum and chlorinated hydrocarbons by anaerobic and aerobic pathways is a recognized and well-documented natural process. This risk assessment did not consider the potential for biodegradation to decrease subsurface contamination over time. Further, the risk assessment did not consider potential depletion of the source due to volatilization and natural attenuation. By ignoring these factors, the risk assessment results may overestimate site exposures, human health risks, and potential impacts to groundwater.

#### **7.3.4.2 Soil Physical Properties**

Vapor diffusion models such as those employed in this risk assessment are sensitive to effective diffusivity and air filled porosity. The effective diffusivity is a function of soil tortuosity, total porosity, and air filled porosity. The air filled soil porosity is equal to the total porosity minus the water filled soil porosity. In general, the higher the air filled porosity, the higher the effective

## **Site Closure Report and Risk Assessment**

Mobil Jalk Fee Property

November 28, 2000

---

diffusivity and resulting potential risk. Therefore, to reduce the uncertainty associated with the model, twelve soil samples collected from the subject site were analyzed for physical parameters were used to estimate the total porosity and air filled porosity at the subject site. These samples were collected from soil borings HS-1, HS-2, HS-3, and HS-4 at depths of between 16 and 56 feet below grade.

Since the majority of the impacted soil is present at depths of less than 20 feet below grade, only the shallow soil samples from each of these borings was used to determine the average total porosity, air-filled porosity, and water-filled porosity. It should be noted that this simplification results in higher rates of vapor diffusion from groundwater as the effective diffusivity of a chemical decreases with an increase in the water-filled porosity. In general, the air-filled porosity of soil samples collected from depths of greater than 16 fbg are less than that of soil samples collected from 16 fbg. The average soil porosity of the samples collected from approximately 16 fbg is 43.2%. The average water-filled and air-filled porosities of the same soil samples are 15.0% and 28.2%, respectively. These values are used in the modeling of vapor diffusion from the subsurface into outdoor air and future site structures. The use of site-specific data in the risk assessment and fate and transport modeling serves to decrease the uncertainty that would otherwise be associated with the use of standardized or default data.

The effective diffusivity is a function of the contaminant diffusion coefficient in air that is experimentally derived. This parameter varies by compound and is influenced by temperature and molecular weight. Because no data are available to support using alternate air diffusion coefficients, chemical air diffusion coefficients cited by USEPA were used in the risk simulations (EPA, 2000).

### **8.0 CONCLUSIONS**

- The objective of the soil remediation efforts outlined in the TRC RAP and revised RAP have been achieved.
- The results of the baseline risk calculations indicate that, under current site conditions, the potential carcinogenic and noncarcinogenic risk to onsite workers prior to initiating site development activities is below acceptable levels as established by the EPA, CalEPA, and other regulatory entities. Consequently, no additional mitigation is warranted in order to protect human health prior to initiating site development activities.
- An evaluation of potential construction worker exposure to both carcinogenic and non-carcinogenic chemicals in soil and groundwater was completed. Potential exposure pathways evaluated for the construction worker exposure included inhalation of VOCs and fugitive dust, dermal contact and incidental ingestion of impacted soil. The upper-bound carcinogenic and non-carcinogenic risks for the construction worker population are below acceptable levels as established by the EPA, CalEPA, and other regulatory entities. The estimated occupational exposures are also well below occupational exposure criteria as established by the Occupational Safety and Health Administration (OSHA), American Conference of Governmental Industrial Hygienists (ACGIH), and National Institute for Occupational Safety and Health (NIOSH). Therefore, no additional mitigation or construction contingencies are necessary to protect from potential exposure to chemicals emanating from soil or groundwater during the site construction. Although the subject site has been adequately characterized and mitigated to below applicable human health thresholds, there is a potential that additional impacted soil may be discovered during construction and development operations. TRC recommends that a construction contingency plan be developed in order to document and detail an appropriate protocol for the management of potential impacted soil that may be encountered during construction work. A construction contingency plan would serve as a primary field guide for decision making by contractors involved in the site development activities.
- Potential carcinogenic and non-carcinogenic risks were quantitatively evaluated under a post-development scenario. Potential exposure pathways evaluated for future onsite employees included indoor and outdoor exposures to VOCs diffusing from residual impacted soil and groundwater. The upper-bound carcinogenic and non-carcinogenic risks for the future onsite worker population are below acceptable levels as established by the EPA, CalEPA, and other regulatory entities. Based on this information, no additional mitigation or control measures are warranted to protect the health of future onsite workers after site development has been completed.
- A supplemental fate and transport analysis was performed in order to evaluate the potential for residual solvents and petroleum hydrocarbons to impact groundwater. The supplemental fate and transport analysis included additional data generated from the two remedial excavation events performed between 1997 and 2000. The results of the supplemental fate

**Site Closure Report and Risk Assessment**  
**Mobil Jalk Fee Property**  
**November 28, 2000**

---

and transport analysis indicate that the potential impact to groundwater underlying the site will not result in a substantial increase in the dissolved-phase hydrocarbon concentrations. Based on the results of the supplemental fate and transport analysis, no additional mitigation or corrective action is necessary to protect groundwater resources beneath the site.

- Based on the results outlined in this report, TRC requests closure for this and previous soil remediation efforts at the Jalk Fee Property.

**APPENDIX A**

**GENERAL FIELD PROCEDURES – SOIL EXCAVATION**

## **APPENDIX A**

### **GENERAL FIELD PROCEDURES-SOIL EXCAVATION**

A description of the general field procedures used during soil excavation and sampling activities is presented below. For an overview of protocol, refer to the appropriate section(s).

#### **SOIL EXCAVATION AND SAMPLING**

Prior to commencing soil excavation activities, all required permits shall be obtained and underground service alert (USA) and agency notifications made. In addition, a pre-construction meeting shall be attended by all field personnel to discuss the scope of work.

Soil excavations shall proceed as outlined in the Remedial Action Plan (RAP). All excavations shall be sloped or shored according to soil types and applicable OSHA regulations. Entering excavations is discouraged. If entering the excavation is required, the site safety officer shall determine if the excavation is safe to enter and that it is not a confined space. Excavated soil shall be stockpiled away from the edge of the excavation and ground observers shall maintain a safe distance from unstable excavation walls.

If backfilling is required, excavations shall be backfilled and compacted in accordance with the project specifications. Imported soil shall be certified clean or profiled to verify that it is not contaminated.

Confirmation soil sampling of the sidewalls and base of the excavation will be completed according to the procedures outlined in the RAP. Entering excavations to sample is discouraged. Sampling can be performed from the bucket of the excavator or using extension rods on a hand auger or other sampling device. Again, if entering the excavation is required, the site safety officer shall determine if the excavation is safe to enter and that it is not a confined space.

#### **SOIL SAMPLE HANDLING**

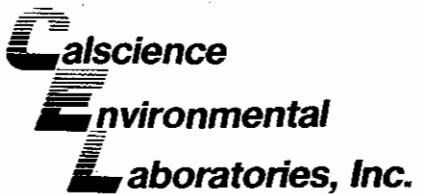

Soil sample handling follows the same basic protocol for both drilling and excavation activities. Upon retrieval, soil samples are immediately removed from the sampler, sealed with Teflon sheeting and polyurethane caps, and wrapped with tape. Each sample is labeled with the project number, boring/well number, sample depth, geologist's initials, and date of collection. After the samples have been labeled and documented in the chain of custody record, they are placed in a cooler with ice at approximately 4 degrees Celsius (°C) prior to and during transport to a state-certified laboratory for analysis. Samples not selected for immediate analysis may be transported in a cooler with ice and archived in a frostless refrigerator at approximately 4°C for possible future testing.

## **CHAIN OF CUSTODY PROTOCOL**

Chain of custody protocol is followed for all soil samples selected for laboratory analysis. The chain of custody form(s) accompanies the samples from the sampling locality to the laboratory, providing a continuous record of possession prior to analysis.

Subject: **Calscience Work Order Number: 00-10-0909**  
Client Reference: **Jalk Fee**

Dear Client:

Enclosed is an analytical report for the above-referenced project. The samples included in this report were received 10/24/00, and analyzed as requested on the attached chain-of-custody record.

The results in this analytical report are limited to the samples tested, and any reproduction of this report must be made in its entirety.

*Note that the Sample Receipt Form and Chain-of-Custody Record are integral parts of this report.*

If you have any questions regarding this report, require sampling supplies or field services, or information about our analytical services, please feel free to call me at (714) 895-5494.

Sincerely,

A handwritten signature in black ink, appearing to read "MJC".

Normal paraffins are used to identify the reported carbon chain ranges. However, there can be a discrepancy for branched, unsaturated, or multiple ring hydrocarbons wherein they may be detected outside of the normal paraffin defined carbon chain range.

Normal paraffins are used to identify the reported carbon chain ranges. However, there can be a discrepancy for branched, unsaturated, or multiple ring hydrocarbons wherein they may be detected outside of the normal paraffin defined carbon chain range.

## GLOSSARY OF TERMS AND QUALIFIERS

Work Order Number: 00-10-0909

<u>Qualifier</u>	<u>Definition</u>
2	Surrogate spike compound was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification.
D	The sample data was reported from a diluted analysis.
E	Concentration exceeds the calibration range.
J	Analyte was detected at a concentration below the reporting limit.
Reported value is estimated.	
ND	Not detected at indicated reporting limit.

Date 10-29-00

# SAMPLE RECEIPT FORM

Work Order Number: 00-10-0909  
Delivery Container Type: Cooler  
Client Project ID: Jalk Fee

Date Received: 10/24/00  
Date Opened: 10/24/00  
Opened By: VP

## Section A: Pass/Fail

### Criteria

	<u>Comments</u>
1. Chain of custody document(s) received with samples.	Yes
2. Sample container label(s) consistent with custody papers.	Yes
3. Sample container label(s) complete (ID, date, time, taken by).	Yes
4. Sample container(s) intact and in good condition.	Yes
5. If applicable, proper preservation noted on sample label(s).	Yes NA for soil c 10/24/00
6. Sufficient sample volume received for analyses requested.	Yes
7. Correct containers used for analyses requested.	Yes
8. If applicable, VOA vials free of headspace.	NA

## Section B: Additional Observations

1. Describe packing materials used in container.	NA
2. Was sample container(s) sealed with custody	No
3. Were all samples sealed in separate plastic bags?	No
4. Measured temperature inside delivery container when opened.	5.0 °C
5. If delivery container shipped by third-party carrier, did container come with shipping slip, airbill, etc.?	No
If YES, attach copy of shipping slip/airbill to the back of this	
6. Do tedlar bags show condensation? Describe below if yes.	NA
7. Are 25.1 condensate traps immersed in dry ice?	NA
8. Are 25.1 sampling trains intact?	NA
9. Are 25.3 condensate vials still attached to the sampling train?	NA
10. Are 25.3 condensate vials on wet ice?	NA

## Section C: Additional Comments

Subject: **Calscience Work Order Number: 00-10-0952**  
Client Reference: **Jalk Fee**

Dear Client:

Enclosed is an analytical report for the above-referenced project. The samples included in this report were received 10/25/00, and analyzed as requested on the attached chain-of-custody record.

The results in this analytical report are limited to the samples tested, and any reproduction of this report must be made in its entirety.

*Note that the Sample Receipt Form and Chain-of-Custody Record are integral parts of this report.*

If you have any questions regarding this report, require sampling supplies or field services, or information about our analytical services, please feel free to call me at (714) 895-5494.

Sincerely,

A handwritten signature in black ink, appearing to read "MJC".

Normal paraffins are used to identify the reported carbon chain ranges. However, there can be a discrepancy for branched, unsaturated, or multiple ring hydrocarbons wherein they may be detected outside of the normal paraffin defined carbon chain range.

## GLOSSARY OF TERMS AND QUALIFIERS

Work Order Number: 00-10-0952

<u>Qualifier</u>	<u>Definition</u>
2	Surrogate spike compound was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification.
J	Analyte was detected at a concentration below the reporting limit. Reported value is estimated.
ND	Not detected at indicated reporting limit.

00-10-0952

Jeff,

On 10/25/00, Calscience received eleven (11) soil samples associated with the Jalk Fee project. On 10/26/00, Glenn Androsko requested that Calscience change the "M9" for samples identified with S22, S23, S24, and S25 to read "M7." This change was made per Glenn Androsko's verbal request, however, a written confirmation from TRC-Alton Geoscience is required in order for us to release the final report.

Will you please confirm that the M9 to M7 change is correct by replying with your answer to this e-mail?

Thanks,  
Mike Crisostomo

## Section A: Pass/Fail

### Criteria

- |   | <u>Comments</u> |
|---|-----------------|
| 1. Chain of custody document(s) received with samples.            | Yes             |
| 2. Sample container label(s) consistent with custody papers.      | Yes             |
| 3. Sample container label(s) complete (ID, date, time, taken by). | Yes             |
| 4. Sample container(s) intact and in good condition.              | Yes             |
| 5. If applicable, proper preservation noted on sample label(s).   | Yes             |
| 6. Sufficient sample volume received for analyses requested.      | Yes             |
| 7. Correct containers used for analyses requested.                | Yes             |
| 8. If applicable, VOA vials free of headspace.                    | NA              |

---

## Section B: Additional Observations

- |   |        |
|---|--------|
| 1. Describe packing materials used in container.  | NA     |
| 2. Was sample container('s) sealed with custody   | No     |
| 3. Were all samples sealed in separate plastic bags?  | No     |
| 4. Measured temperature inside delivery container when opened.  | 4.0 °C |
| 5. If delivery container shipped by third-party carrier,<br>did container come with shipping slip, airbill, etc.? | No     |
| If YES, attach copy of shipping slip/airbill to the back of this  |        |
| 6. Do tedlar bags show condensation? Describe below if yes.   | NA     |
| 7. Are 25.1 condensate traps immersed in dry ice?   | NA     |
| 8. Are 25.1 sampling trains intact?   | NA     |
| 9. Are 25.3 condensate vials still attached to the sampling train?  | NA     |
| 10. Are 25.3 condensate vials on wet ice?   | NA     |

**Client Reference:** Jalk Fee

Dear Client:

Enclosed is an analytical report for the above-referenced project. The samples included in this report were received 10/26/00, and analyzed as requested on the attached chain-of-custody record.

The results in this analytical report are limited to the sample tested, and any reproduction of this report must be made in its entirety.

*Note that the Sample Receipt Form and Chain of Custody Record are integral parts of this report.*

If you have any questions regarding this report, require sampling supplies or field services, or information about our analytical services, please feel free to call me at (714) 895-5494.

Sincerely,

A handwritten signature in black ink, appearing to read "MJC".

Total	9540	100

Normal paraffins are used to identify the reported carbon chain ranges. However, there can be a discrepancy for branched, unsaturated, or multiple ring hydrocarbons wherein they may be detected outside of the normal paraffin defined carbon chain range. Heavier hydrocarbons greater than C40 were also detected.

Page 6 of 6

Attn: Jeff Hensel  
RE: Jalk Fee

All hydrocarbon concentrations are quantified using a diesel fuel standard, and are reported in mg/kg (ppm). Reporting limits for the individual carbon ranges are not defined.

Normal paraffins are used to identify the reported carbon chain ranges. However, there can be a discrepancy for branched, unsaturated, or multiple ring hydrocarbons wherein they may be detected outside of the normal paraffin defined carbon chain range.

ND denotes not detected at indicated reportable limit.

Each sample was received by CEL chilled, intact, and with chain-of-custody attached.

Work Order Number: 00-10-1047

Delivery Container Type: Cooler

Client Project ID: 18 FEE *Talk Fee*  
*10/26/00*

Date Received: 10/26/00

Date Opened: 10/26/00

Opened By: JP

## Section A: Pass/Fail

### Criteria

- |   | <u>Comments</u> |
|---|-----------------|
| 1. Chain of custody document(s) received with samples.            | Yes -           |
| 2. Sample container label(s) consistent with custody papers.      | Yes -           |
| 3. Sample container label(s) complete (ID, date, time, taken by). | Yes .           |
| 4. Sample container(s) intact and in good condition.              | Yes -           |
| 5. If applicable, proper preservation noted on sample label(s).   | NA -            |
| 6. Sufficient sample volume received for analyses requested.      | Yes -           |
| 7. Correct containers used for analyses requested.                | Yes .           |
| 8. If applicable, VOA vials free of headspace.                    | NA -            |

## Section B: Additional Observations

- |   |        |
|---|--------|
| 1. Describe packing materials used in container.  | NA     |
| 2. Was sample container('s) sealed with custody   | No     |
| 3. Were all samples sealed in separate plastic bags?  | No     |
| 4. Measured temperature inside delivery container when opened.  | 4.0 °C |
| 5. If delivery container shipped by third-party carrier,<br>did container come with shipping slip, airbill, etc.? | No     |
| If YES, attach copy of shipping slip/airbill to the back of this  |        |
| 6. Do tedlar bags show condensation? Describe below if yes.   | NA     |
| 7. Are 25.1 condensate traps immersed in dry ice?   | NA     |
| 8. Are 25.1 sampling trains intact?   | NA     |
| 9. Are 25.3 condensate vials still attached to the sampling train?  | NA     |
| 10. Are 25.3 condensate vials on wet ice?   | NA     |

Subject: **Calscience Work Order Number: 00-10-1211**  
Client Reference: **Mobil - JALK FEE**

Dear Client:

Enclosed is an analytical report for the above-referenced project. The samples included in this report were received 10/30/00, and analyzed as requested on the attached chain-of-custody record.

The results in this analytical report are limited to the sample tested, and any reproduction of this report must be made in its entirety.

*Note that the Sample Receipt Form and Chain of Custody Record are integral parts of this report.*

If you have any questions regarding this report, require sampling supplies or field services, or information about our analytical services, please feel free to call me at (714) 895-5494.

Sincerely,

A handwritten signature in black ink, appearing to read "M.J.C." followed by a stylized surname.

RE: Mobil - JALK FEE

All hydrocarbon concentrations are quantified using a diesel fuel standard, and are reported in mg/kg (ppm). Reporting limits for the individual carbon ranges are not defined.

Normal paraffins are used to identify the reported carbon chain ranges. However, there can be a discrepancy for branched, unsaturated, or multiple ring hydrocarbons wherein they may be detected outside of the normal paraffin defined carbon chain range.

## GLOSSARY OF TERMS AND QUALIFIERS

Work Order Number: 00-10-1211

<u>Qualifier</u>	<u>Definition</u>
2	Surrogate spike compound was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification.
J	Analyte was detected at a concentration below the reporting limit. Reported value is estimated.
ND	Not detected at indicated reporting limit.
X	% Recovery and/or RPD out-of-range.

## Section A: Pass/Fail

### Criteria

- |   | <u>Comments</u> |
|---|-----------------|
| 1. Chain of custody document(s) received with samples.            | Yes             |
| 2. Sample container label(s) consistent with custody papers.      | Yes             |
| 3. Sample container label(s) complete (ID, date, time, taken by). | Yes             |
| 4. Sample container(s) intact and in good condition.              | Yes             |
| 5. If applicable, proper preservation noted on sample label(s).   | NA              |
| 6. Sufficient sample volume received for analyses requested.      | Yes             |
| 7. Correct containers used for analyses requested.                | Yes             |
| 8. If applicable, VOA vials free of headspace.                    | NA              |

---

## Section B: Additional Observations

- |   |             |
|---|-------------|
| 1. Describe packing materials used in container.  | NA          |
| 2. Was sample container(s) sealed with custody  | No          |
| 3. Were all samples sealed in separate plastic bags?  | No          |
| 4. Measured temperature inside delivery container when opened.  | 3.0      °C |
| 5. If delivery container shipped by third-party carrier,<br>did container come with shipping slip, airbill, etc.? | No          |
| If YES, attach copy of shipping slip/airbill to the back of this  |             |
| 6. Do tedlar bags show condensation? Describe below if yes.   | NA          |
| 7. Are 25.1 condensate traps immersed in dry ice?   | NA          |
| 8. Are 25.1 sampling trains intact?   | NA          |
| 9. Are 25.3 condensate vials still attached to the sampling train?  | NA          |
| 10. Are 25.3 condensate vials on wet ice?   | NA          |

Irvine, CA 92618

Subject: **Calscience Work Order Number: 00-10-1272**  
**Client Reference: JALK FEE**

Dear Client:

Enclosed is an analytical report for the above-referenced project. The samples included in this report were received 10/31/00, and analyzed as requested on the attached chain-of-custody record.

The results in this analytical report are limited to the samples tested, and any reproduction of this report must be made in its entirety.

*Note that the Sample Receipt Form and Chain-of-Custody Record are integral parts of this report.*

If you have any questions regarding this report, require sampling supplies or field services, or information about our analytical services, please feel free to call me at (714) 895-5494.

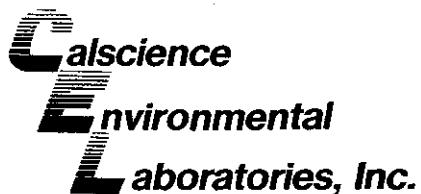

Sincerely,

A handwritten signature in black ink, appearing to read "mjc".

## ANALYTICAL REPORT

TRC-Alton Geoscience  
21 Technology Drive  
Irvine, CA 92618

Attn: Jeff Hensel  
RE: Jalk Fee

Date Sampled: 10/31/00  
Date Received: 10/31/00  
Date Extracted: 10/31/00  
Date Analyzed: 11/01/00  
Work Order No.: 00-10-1272  
Method: EPA 8015M with Carbon Chain  
Page 1 of 4

All hydrocarbon concentrations are quantified using a diesel fuel standard, and are reported in mg/kg (ppm). Reporting limits for the individual carbon ranges are not defined.

<u>Analyte</u>	<u>Concentration</u>	<u>Reporting Limit</u>

C29-C32	ND	
C33-C36	ND	
C37-C40	ND	
C7-C40 Total	ND	5

Normal paraffins are used to identify the reported carbon chain ranges. However, there can be a discrepancy for branched, unsaturated, or multiple ring hydrocarbons wherein they may be detected outside of the normal paraffin defined carbon chain range.

## Section A: Pass/Fail

### Criteria

- |   | <u>Comments</u> |
|---|-----------------|
| 1. Chain of custody document(s) received with samples.            | Yes             |
| 2. Sample container label(s) consistent with custody papers.      | Yes             |
| 3. Sample container label(s) complete (ID, date, time, taken by). | Yes             |
| 4. Sample container(s) intact and in good condition.              | Yes             |
| 5. If applicable, proper preservation noted on sample label(s).   | Yes             |
| 6. Sufficient sample volume received for analyses requested.      | Yes             |
| 7. Correct containers used for analyses requested.                | Yes             |
| 8. If applicable, VOA vials free of headspace.                    | NA              |

---

## Section B: Additional Observations

- |   |             |
|---|-------------|
| 1. Describe packing materials used in container.  | Bubble Wrap |
| 2. Was sample container('s) sealed with custody   | No          |
| 3. Were all samples sealed in separate plastic bags?  | No          |
| 4. Measured temperature inside delivery container when opened.  | 4.0 °C      |
| 5. If delivery container shipped by third-party carrier,<br>did container come with shipping slip, airbill, etc.?<br>If YES, attach copy of shipping slip/airbill to the back of this | No          |
| 6. Do tedlar bags show condensation? Describe below if yes.   | NA          |
| 7. Are 25.1 condensate traps immersed in dry ice?   | NA          |
| 8. Are 25.1 sampling trains intact?   | NA          |
| 9. Are 25.3 condensate vials still attached to the sampling train?  | NA          |
| 10. Are 25.3 condensate vials on wet ice?   | NA          |

Subject: **Calscience Work Order Number: 00-11-0032**  
**Client Reference: Mobil - JALK FEE**

Dear Client:

Enclosed is an analytical report for the above-referenced project. The samples included in this report were received 11/01/00, and analyzed as requested on the attached chain-of-custody record.

The results in this analytical report are limited to the sample tested, and any reproduction of this report must be made in its entirety.

*Note that the Sample Receipt Form and Chain of Custody Record are integral parts of this report.*

If you have any questions regarding this report, require sampling supplies or field services, or information about our analytical services, please feel free to call me at (714) 895-5494.

Sincerely,

A handwritten signature in black ink, appearing to read "M.J.C."/

**ANALYTICAL REPORT**

TRC-Alton Geoscience  
21 Technology Drive  
Irvine, CA 92618

Date Sampled: 11/01/00  
Date Received: 11/01/00  
Date Extracted: 11/01/00  
Date Analyzed: 11/02/00  
Work Order No.: 00-11-0032  
Method: EPA 8015M with Carbon Chain  
Page 1 of 2

Attn: Jeff Hensel  
RE: Mobil - JALK FEE

All hydrocarbon concentrations are quantified using a diesel fuel standard, and are reported in mg/kg (ppm). Reporting limits for the individual carbon ranges are not defined.

<u>Analyte</u>	<u>Concentration</u>	<u>Reporting Limit</u>
<b>Sample Number: JF-M9-S19B-B-16</b>		
C7	ND	
C8	27	
C9-C10	1420	
C11-C12	2350

C37-C40	1220	
C7-C40 Total	23200	250

Normal paraffins are used to identify the reported carbon chain ranges. However, there can be a discrepancy for branched, unsaturated, or multiple ring hydrocarbons wherein they may be detected outside of the normal paraffin defined carbon chain range.

Normal paraffins are used to identify the reported carbon chain ranges. However, there can be a discrepancy for branched, unsaturated, or multiple ring hydrocarbons wherein they may be detected outside of the normal paraffin defined carbon chain range.

ND denotes not detected at indicated reportable limit.

Each sample was received by CEL chilled, intact, and with chain-of-custody attached.

## Section A: Pass/Fail

### Criteria

- |   | <u>Comments</u> |
|---|-----------------|
| 1. Chain of custody document(s) received with samples.            | Yes             |
| 2. Sample container label(s) consistent with custody papers.      | Yes             |
| 3. Sample container label(s) complete (ID, date, time, taken by). | Yes             |
| 4. Sample container(s) intact and in good condition.              | Yes             |
| 5. If applicable, proper preservation noted on sample label(s).   | Yes             |
| 6. Sufficient sample volume received for analyses requested.      | Yes             |
| 7. Correct containers used for analyses requested.                | Yes             |
| 8. If applicable, VOA vials free of headspace.                    | NA              |

---

## Section B: Additional Observations

- |   |        |
|---|--------|
| 1. Describe packing materials used in container.  | NA     |
| 2. Was sample container('s) sealed with custody   | No     |
| 3. Were all samples sealed in separate plastic bags?  | No     |
| 4. Measured temperature inside delivery container when opened.  | 4.0 °C |
| 5. If delivery container shipped by third-party carrier,<br>did container come with shipping slip, airbill, etc.?<br>If YES, attach copy of shipping slip/airbill to the back of this | No     |
| 6. Do tedlar bags show condensation? Describe below if yes.   | NA     |
| 7. Are 25.1 condensate traps immersed in dry ice?   | NA     |
| 8. Are 25.1 sampling trains intact?   | NA     |
| 9. Are 25.3 condensate vials still attached to the sampling train?  | NA     |
| 10. Are 25.3 condensate vials on wet ice?   | NA     |

Subject: **Calscience Work Order Number: 00-11-0093**  
**Client Reference: JALK FEE**

Dear Client:

Enclosed is an analytical report for the above-referenced project. The samples included in this report were received 11/02/00, and analyzed as requested on the attached chain-of-custody record.

The results in this analytical report are limited to the samples tested, and any reproduction of this report must be made in its entirety.

*Note that the Sample Receipt Form and Chain-of-Custody Record are integral parts of this report.*

If you have any questions regarding this report, require sampling supplies or field services, or information about our analytical services, please feel free to call me at (714) 895-5494.

Sincerely,

A handwritten signature in black ink, appearing to read "M.J.C." followed by a stylized surname.

## Section A: Pass/Fail

### Criteria

- |   | <u>Comments</u> |
|---|-----------------|
| 1. Chain of custody document(s) received with samples.            | Yes             |
| 2. Sample container label(s) consistent with custody papers.      | Yes             |
| 3. Sample container label(s) complete (ID, date, time, taken by). | Yes             |
| 4. Sample container(s) intact and in good condition.              | Yes             |
| 5. If applicable, proper preservation noted on sample label(s).   | Yes             |
| 6. Sufficient sample volume received for analyses requested.      | Yes             |
| 7. Correct containers used for analyses requested.                | Yes             |
| 8. If applicable, VOA vials free of headspace.                    | NA              |

---

## Section B: Additional Observations

- |   |        |
|---|--------|
| 1. Describe packing materials used in container.  | NA     |
| 2. Was sample container('s) sealed with custody   | No     |
| 3. Were all samples sealed in separate plastic bags?  | No     |
| 4. Measured temperature inside delivery container when opened.  | 4.0 °C |
| 5. If delivery container shipped by third-party carrier,<br>did container come with shipping slip, airbill, etc.? | No     |
| If YES, attach copy of shipping slip/airbill to the back of this  |        |
| 6. Do tedlar bags show condensation? Describe below if yes.   | NA     |
| 7. Are 25.1 condensate traps immersed in dry ice?   | NA     |
| 8. Are 25.1 sampling trains intact?   | NA     |
| 9. Are 25.3 condensate vials still attached to the sampling train?  | NA     |
| 10. Are 25.3 condensate vials on wet ice?   | NA     |

Subject: **Calscience Work Order Number: 00-11-0232**  
**Client Reference: Jalk Fee**

Dear Client:

Enclosed is an analytical report for the above-referenced project. The samples included in this report were received 11/06/00, and analyzed as requested on the attached chain-of-custody record.

The results in this analytical report are limited to the samples tested, and any reproduction of this report must be made in its entirety.

*Note that the Sample Receipt Form and Chain-of-Custody Record are integral parts of this report.*

If you have any questions regarding this report, require sampling supplies or field services, or information about our analytical services, please feel free to call me at (714) 895-5494.

Sincerely,

A handwritten signature in black ink, appearing to read "MJC".

## ANALYTICAL REPORT

TRC-Alton Geoscience  
21 Technology Drive  
Irvine, CA 92618

Attn: Jeff Hensel  
RE: Jalk Fee

Date Sampled: 11/06/00  
Date Received: 11/06/00  
Date Extracted: 11/08/00  
Date Analyzed: 11/08/00  
Work Order No.: 00-11-0232  
Method: EPA 8015M with Carbon Chain  
Page 1 of 2

All hydrocarbon concentrations are quantified using a diesel fuel standard, and are reported in mg/kg (ppm). Reporting limits for the individual carbon ranges are not defined.

<u>Analyte</u>	<u>Concentration</u>	<u>Reporting Limit</u>
<b>Sample Number: JF-M9-S19C-B-24</b>		
C7	ND	
C8	112	
C9-C10	242	
C11-C12	304	
C13-C14	323	
C15-C16	285	
C17-C18	254

C29-C32	164	
C33-C36	86	
C37-C40	104	
C7-C40 Total	2570	25

Normal paraffins are used to identify the reported carbon chain ranges. However, there can be a discrepancy for branched, unsaturated, or multiple ring hydrocarbons wherein they may be detected outside of the normal paraffin defined carbon chain range.

Normal paraffins are used to identify the reported carbon chain ranges. However, there can be a discrepancy for branched, unsaturated, or multiple ring hydrocarbons wherein they may be detected outside of the normal paraffin defined carbon chain range.

ND denotes not detected at indicated reportable limit.

Each sample was received by CEL chilled, intact, and with chain-of-custody attached.

## QUALITY ASSURANCE SUMMARY

Method EPA 8015M - Carbon Chain

TRC-Alton Geoscience

# SAMPLE RECEIPT FORM

Work Order Number: **00-11-0232** Date Received: **11/06/00**  
Delivery Container Type: **Cooler** Date Opened: **11/06/00**  
Client Project ID: **Jalk Fee** Opened By: **NC**

## Section A: Pass/Fail

### Criteria

- |   | <u>Comments</u> |
|---|-----------------|
| 1. Chain of custody document(s) received with samples.            | Yes             |
| 2. Sample container label(s) consistent with custody papers.      | Yes             |
| 3. Sample container label(s) complete (ID, date, time, taken by). | Yes             |
| 4. Sample container(s) intact and in good condition.              | Yes             |
| 5. If applicable, proper preservation noted on sample label(s).   | NA              |
| 6. Sufficient sample volume received for analyses requested.      | Yes             |
| 7. Correct containers used for analyses requested.                | Yes             |
| 8. If applicable, VOA vials free of headspace.                    | NA              |

## Section B: Additional Observations

- |   |        |
|---|--------|
| 1. Describe packing materials used in container.  | NA     |
| 2. Was sample container(s) sealed with custody  | Yes    |
| 3. Were all samples sealed in separate plastic bags?  | No     |
| 4. Measured temperature inside delivery container when opened.  | 4.0 °C |
| 5. If delivery container shipped by third-party carrier,<br>did container come with shipping slip, airbill, etc.? | Yes    |
| If YES, attach copy of shipping slip/airbill to the back of this  |        |
| 6. Do tedlar bags show condensation? Describe below if yes.   | NA     |
| 7. Are 25.1 condensate traps immersed in dry ice?   | NA     |
| 8. Are 25.1 sampling trains intact?   | NA     |
| 9. Are 25.3 condensate vials still attached to the sampling train?  | NA     |
| 10. Are 25.3 condensate vials on wet ice?   | NA     |

Attention: Irving Chung

Apollo Analytics Inc., has received the following sample(s):

<u>Date Received</u>	<u>Quantity</u>	<u>Matrix</u>
September 27, 2000	2	Soil

The sample(s) received were analyzed for total petroleum hydrocarbons as gasoline and diesel using EPA method 8015M, total recoverable petroleum hydrocarbons using EPA method 418.1 and BTEX/MTBE using EPA method 8020.

The results of these analyses and the quality control are enclosed. If you have any questions please do not hesitate to call (714) 751-3210.

Attention: Irving Chung

Apollo Analytics Inc., has received the following sample(s):

<u>Date Received</u>	<u>Quantity</u>	<u>Matrix</u>
September 27, 2000	2	Soil

The sample(s) received were analyzed for total petroleum hydrocarbons as gasoline and diesel using EPA method 8015M, total recoverable petroleum hydrocarbons using EPA method 418.1 and BTEX/MTBE using EPA method 8020.

The results of these analyses and the quality control are enclosed. If you have any questions please do not hesitate to call (714) 751-3210.

Irvine, CA 92718

Attention: Mr. Jeff Hensel

Subject: Report/Laboratory Test Results  
Project Name: Jalk Fee  
Project No.: 00-0265  
KTL Project No.: 00-056-003

Dear Mr. Hensel:

Enclosed are results of the laboratory testing program conducted on samples from the above referenced project. The testing performed for this program was conducted in general accordance with testing procedures as follows:

TYPE OF TEST

Modified Proctor

TEST PROCEDURE

ASTM D 1557

Attached herewith are Modified Compaction Test Results(2).

We appreciate the opportunity to provide testing services to TRC Environmental Solutions, Inc. If you have any questions regarding the test results, please contact us.

Very truly yours,  
Keantan Laboratories

  
Kean Tan, PE  
Principal

Encls.

## 1.0 TECHNICAL APPROACH

The technical approach for simulations performed for this risk assessment is described in Section 7.0 in the main body of this report.

## 2.0 EQUATIONS

Estimates of potential human exposures to environmental contaminants hinge on the concept of determining empirically or estimating mathematically the exposure or dose of chemical received. This dose is expressed in terms of milligrams of chemical per kilogram of body weight per averaged over a period of one day (i.e., mg/kg-day). Once the dose of chemical received has been quantified, the resulting exposure estimate may be compared to acceptable exposure levels (as is the case with exposure to non-carcinogenic chemicals) or multiplied by a quantitative estimate of the chemical's inherent ability to induce cancer (i.e., cancer slope factor) in order to obtain a quantitative estimate of potential "risk".

While the methodologies for evaluating carcinogenic and non-carcinogenic chemicals differ slightly, chemical exposure (or dose) for carcinogenic and non-carcinogenic chemicals is quantified in essentially the same manner. Since exposure to carcinogens is average over a lifetime and exposure to non-carcinogens is averaged over the exposure period, the averaging time differs for carcinogenic and non-carcinogenic dose estimates. The following equation provides a simplified equation for calculating chemical exposure (or dose). The toxicity criteria and exposure parameters used in the assessment are presented in Tables E-5 and E-6.

$$Dose = \frac{C * ER * EF * ED}{BW * AT} \quad (Equation\ 1)$$

where,

Dose = Chemical exposure (mg/kg-day)

C = Concentration of chemical in matrix (mass of chemical/unit measure of matrix)

ER = Exposure rate (units/day)

EF = exposure frequency (days/yr)

ED = exposure duration (yr)

BW = body weight (kg)

AT = averaging time (days)

mg = milligrams

kg = kilograms

yr = year

For carcinogens, the dose of chemical received over a lifetime is expressed in terms of mg/kg-day. Since this dose is averaged over the average lifetime of 70 years, this term is often referred to as the Lifetime Average Daily Dose or LADD. A quantitative estimate

of risk is derived by multiplying the LADD by the Cancer Slope Factor (CSF). As the CSF is expressed in terms of  $(\text{mg/kg-day})^{-1}$ , the resulting incremental cancer risk estimate is unitless.

$$Risk = LADD * CSF \quad (\text{Equation 2})$$

Non-carcinogenic exposure is also expressed in terms of mg/kg-day. However, the dose is averaged over the duration of the exposure period rather than the lifetime of the individual and is expressed in terms of Average Daily Dose (ADD). A determination of potential risk is obtained by comparing the dose of chemical received to the Reference Dose. The Reference Dose reflects the dose an individual can receive on a daily basis over an entire lifetime without experiencing adverse health effects. The quantitative evaluation of potential non-carcinogenic health effects is expressed as the Hazard Index according to the expression described below:

$$Hazard Index (HI) = ADD / RfD \quad (\text{Equation 3})$$

If the dose of chemical received exceeds the Reference Dose, the resulting quotient (a.k.a. Hazard Index or Hazard Quotient) will exceed unity (i.e., 1.0) and the potential for adverse non-carcinogenic health effects is assumed to exist. Conversely, a Hazard Index of less than 1.0 indicates that the potential for adverse, non-carcinogenic health effects is insignificant, even for sensitive sub-populations.

The various simulations presented herein were run using concentration parameters that are interpreted to represent a reasonable maximum exposure scenario. The reasonable maximum concentration is based on a statistical evaluation of the upper confidence interval of the arithmetic or geometric mean for a chemical of potential concern (COPC).

## 2.1 BASELINE CONDITIONS

Baseline conditions were used only for a human, such as a security guard or construction supervisor, not involved in soil disruption activities such as trenching and grading. Equations 1 through 3 were used to estimate the risk. The outdoor vapor concentration originating from impacted soil to which an individual could potentially be exposed under the baseline conditions was calculated as follows:

$$C_a = \frac{C_s}{VF} \quad (\text{Equation 4})$$

For soil - outdoor air, VF was calculated using the following equation (Table E-9):

$$VF_o = \left( \frac{Q}{C} \right) \frac{(3.14 * \alpha * T)^{\frac{1}{2}}}{(2 * D_e * P_a * K_{as})} 10^{-4} m^2 / cm^2 \quad (Equation\ 5)$$

The incremental lifetime cancer risks and hazard indices were derived from the dose calculations described in Equations 1 through 3 for the baseline exposure scenario (Tables E-7 and E-8).

## 2.2 CONSTRUCTION WORKERS AND POST-DEVELOPMENT EMPLOYEES

### 2.2.1 Vapor Inhalation

The incremental lifetime cancer risk and hazard index were estimated for outdoor construction workers, future outdoor workers, and future indoor workers on the subject property. Vapor concentrations originating from both impacted soil and groundwater were evaluated.

#### 2.2.1.1 Vapors Originating from Impacted Soil

The outdoor vapor concentrations originating from impacted soil to which construction workers potentially could be exposed and the indoor vapor concentrations to which future onsite employees could potentially be exposed were calculated as follows:

$$C_a = \frac{C_s}{VF} \quad (Equation\ 6)$$

where

C<sub>a</sub> = concentration in air (mg/m<sup>3</sup>)

C<sub>s</sub> = concentration in soil (mg/kg)

VF = volatilization factor (m<sup>3</sup>/kg)

m = meters

The outdoor vapor concentrations originating from impacted soil to which outdoor employees potentially will be exposed were calculated as follows:

$$C_a = \frac{C_s}{VF} * AF \quad (Equation\ 7)$$

where

AF = attenuation factor (unitless)

Site Closure Report and Risk Assessment  
 Mobil Jalk Fee Property  
 November 28, 2000

---

Note that an AF is included for future outdoor employees because the outdoor VF parameter for outdoor exposures does not include an AF parameter. Since the majority of the subject site will be paved following construction activities, the AF was included.

For soil - outdoor air, VF was calculated using the following equation (Table E-9):

$$VF_o = \frac{Q}{C} \frac{(3.14 * \alpha * T)^{\frac{1}{2}}}{(2 * D_e * P_a * K_{as})} 10^{-4} m^2 / cm^2 \quad (Equation 8)$$

For soil - indoor air, VF was calculated using the following equation (Table E-10):

$$VF_i = \frac{VR}{(A * AF)} \frac{(3.14 * \alpha * T)^{\frac{1}{2}}}{(2 * D_e * P_a * K_{as} 10^{-3} kg/g)} \quad (Equation 9)$$

where,

$$\square = \frac{D_{ei} * P_a}{P_a + [(PD)(1 - P_a) / K_{as}]}$$

$$D_e = D_i (P_a^{3.33} / P_t^2)$$

$$P_a = P_t - wPD$$

$$BD = (1 - P_t)PD$$

$$K_{as} = (H / K_d)$$

$$K_d = K_{oc} f_{oc}$$

VR = ventilation rate ( $m^3/s$ )

A = area of contamination ( $cm^2$ )

AF = attenuation factor (dimensionless)

VF = Volatilization factor ( $m^3/kg$ )

Q/C = Inverse of the mean concentration at the center of an 8 acre source.  
 $(43.585 \text{ g/m}^2 \cdot \text{s per kg/m}^3, \text{ EPA, 1996})$

T = exposure interval (s)

$D_e$  = effective diffusivity ( $cm^2/s$ )

$P_a$  = air filled soil porosity (fraction)

$D_i$  = diffusivity in air ( $cm^2/s$ )

$P_t$  = total soil porosity (fraction)

w = soil moisture content (fraction)

BD = bulk density ( $\text{g}/\text{cm}^3$ )  
PD = soil particle density ( $\text{g}/\text{cm}^3$ )  
 $K_{as}$  = soil-air partition coefficient ( $\text{g-soil}/\text{cm}^3\text{-air}$ )  
 $H$  = Henry's Law constant (dimensionless)  
 $K_d$  = soil-water partition coefficient ( $\text{cm}^3/\text{g}$ )  
 $K_{oc}$  = soil organic carbon/water partition coefficient ( $\text{cm}^3/\text{g}$ )  
 $f_{oc}$  = fraction organic carbon content (dimensionless)

The incremental lifetime cancer risks and hazard indices were derived from the dose calculations described in Equations 1 through 3 for outdoor construction workers (Tables E-13 and E-14), future outdoor employees (Tables E-17 and E-18), and future indoor employees (Tables E-21 and E-22).

#### 2.2.1.2 Vapors Originating from Impacted Groundwater

The outdoor vapor concentrations originating from impacted groundwater to which construction workers potentially could potentially be exposed and the indoor vapor concentrations which future indoor employees could potentially be exposed were calculated as follows:

$$C_a = \frac{C_w}{VF} \quad (\text{Equation 10})$$

where

$C_w$  = concentration in groundwater ( $\text{mg/l}$ )

l = liters

The outdoor vapor concentrations originating from impacted groundwater to which future outdoor employees could potentially be exposed were calculated as follows:

$$C_a = \frac{C_w}{VF} * AF \quad (\text{Equation 11})$$

Note that a slab attenuation factor (AF) is included for future outdoor employees because the outdoor volatilization factor (VF) parameter for outdoor exposures does not include an AF parameter. Because the vast majority of the subject property will be paved after development, the AF was included.

For the vapor flux from groundwater to outdoor air, VF was calculated using the following equation (Table E-11):

Site Closure Report and Risk Assessment  
 Mobil Jalk Fee Property  
 November 28, 2000

---

$$VF_o = \left( \frac{Q}{C} \right) \frac{L}{\left( H * 1000 \frac{l}{m^3} * D_e \right)} \quad (Equation \ 12)$$

For the vapor flux from groundwater to indoor air, VF was calculated using the following equation (Table E-12)

$$VF_i = \frac{VR}{(A * AF)} \frac{L}{\left( H * 1000 \frac{l}{m^3} * D_e \right)} \quad (Equation \ 13)$$

where:

$Q/C$  = inverse of the mean concentration at center of source (m/hr)

$L$  = depth to contaminated groundwater

The incremental lifetime cancer risks and hazard indices were derived from the dose calculations described in Equations 1 through 3 for construction workers (Tables E-15 and E-16), future outdoor employees (Tables E-19 and E-20), and future indoor employees (Tables E-23 and E-24).

### 2.2.2 Particulate Emissions

The incremental lifetime cancer risk and hazard index were estimated for outdoor construction workers.

The particulate emission factor was calculated as follows (Table E-25):

$$PEF = \frac{\left( LS * WS * MH * 3600 \frac{s}{hr} \right)}{A} * \frac{1000 \frac{g}{kg}}{0.036 * (1 - G) * \left( \frac{U_m}{U_t} \right)^3 * F(x)} \quad (Equation \ 14)$$

where,

$PEF$  = particulate emission factor ( $m^3/kg$ )

$LS$  = width of contaminated area (m)

$WS$  = wind speed in mixing zone (m/s)

$MH$  = diffusion height (m)

$A$  = area of contamination ( $m^2$ )

$0.036$  = respirable fraction ( $g/m^2\text{-hr}$ )

$G$  = fraction of vegetative cover (unitless)

$U_m$  = mean annual wind speed (m/s)

$U_t$  = equivalent threshold value of wind speed at 10 m (m/s)

$F(x) = \text{function dependent on } U_m/U_t \text{ (unitless)}$

The incremental lifetime cancer risk (Table E-26) and hazard index (Table E-27) for exposure to chemicals present in fugitive dust were calculated using Equations 1 through 3, respectively. The chemical dose was calculated using the following equation:

$$Dose = \frac{Cs * IR * ET * EF * ED * (1 / PEF)}{BW * AT} \quad (\text{Equation 15})$$

where,

Dose = Chemical intake (mg/kg-day)

Cs = concentration in soil (mg/kg)

IR = inhalation rate ( $m^3/\text{hour}$ )

ET = exposure time (hr/day)

EF = exposure frequency (days/yr)

ED = exposure duration (yr)

PEF = Particulate emission factor ( $m^3/\text{kg}$ )

BW = body weight (kg)

AT = averaging time (days)

#### 2.2.3 Ingestion of Soil

The incremental lifetime cancer risk and hazard index were estimated for construction workers from the following overview of the dose calculation (Tables E-28 and E-29):

$$Dose = \frac{Cs * 10^{-6} \text{ kg/mg} * EF * IR * ED}{AT * BW} \quad (\text{Equation 16})$$

where,

Cs = Concentration of chemical in soil (mg/kg)

IR = Soil ingestion rate (mg/day)

EF = exposure frequency (days/yr)

ED = exposure duration (yr)

AT = averaging time (days)

BW = body weight (kg)

#### 2.2.4 Dermal Contact with Soil

The incremental lifetime cancer risk and hazard index were estimated for construction workers from the following dose calculation (Tables E-30 and E-31).

Site Closure Report and Risk Assessment

Mobil Jalk Fee Property

November 28, 2000

---

$$Dose = \frac{Cs * SA * AF * AC * 10^{-6} \text{ kg/mg} * EF * ED}{AT * BW} \quad (\text{Equation 17})$$

where,

Cs = Concentration of chemical in soil (mg/kg)

SA = Surface area of exposed skin (cm<sup>2</sup>)

AF = Soil/Skin adherence factor (mg soil/cm<sup>2</sup> skin-day)

AC = Absorption coefficient for chemical across dermis (unitless)

EF = exposure frequency (days/yr)

ED = exposure duration (yr)

AT = averaging time (days)

BW = Body weight (kg)

yr = year

Notes:

mg/kg = milligrams per kilogram

NA = not applicable

LT = log transformed data

<sup>1</sup> Assumes random sampling and/or systematic random sampling.

<sup>2</sup> Based on Gilbert, 1987
